TEAQUILA

Field of research

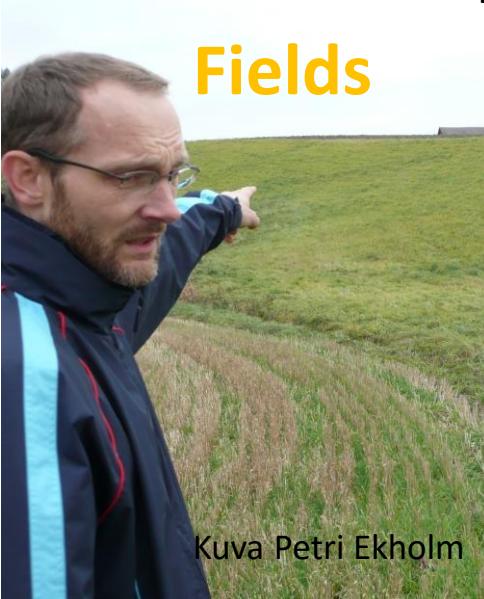

Coupled biogeochemical cycles through respiration processes

Land-cover regulates export of terminal electron acceptors (TEAs)

Palviainen, M., Lehtoranta, J., Ekholm, P. and Kortelainen, P. 2015.
Land-cover controls the export of terminal electron acceptors from boreal catchments. *Ecosystems* 18: 343–358.

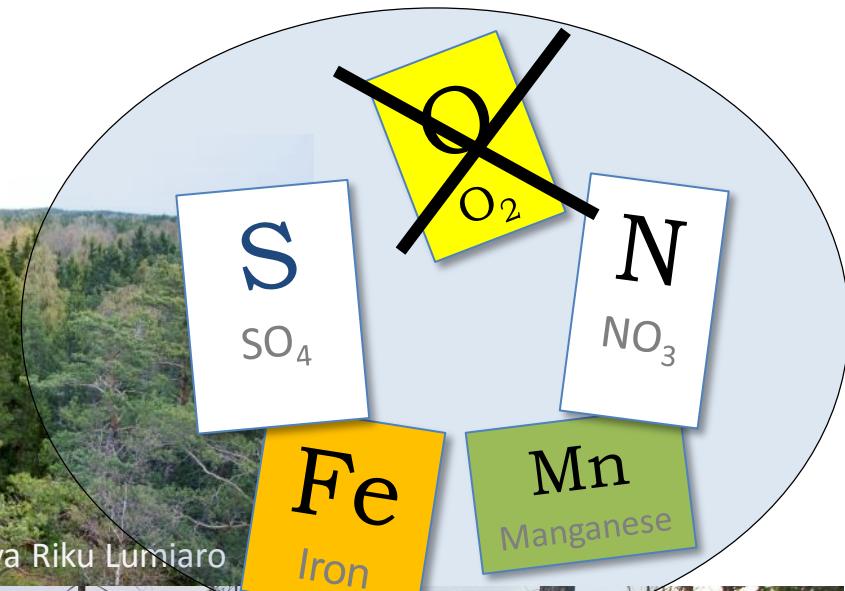

Fields

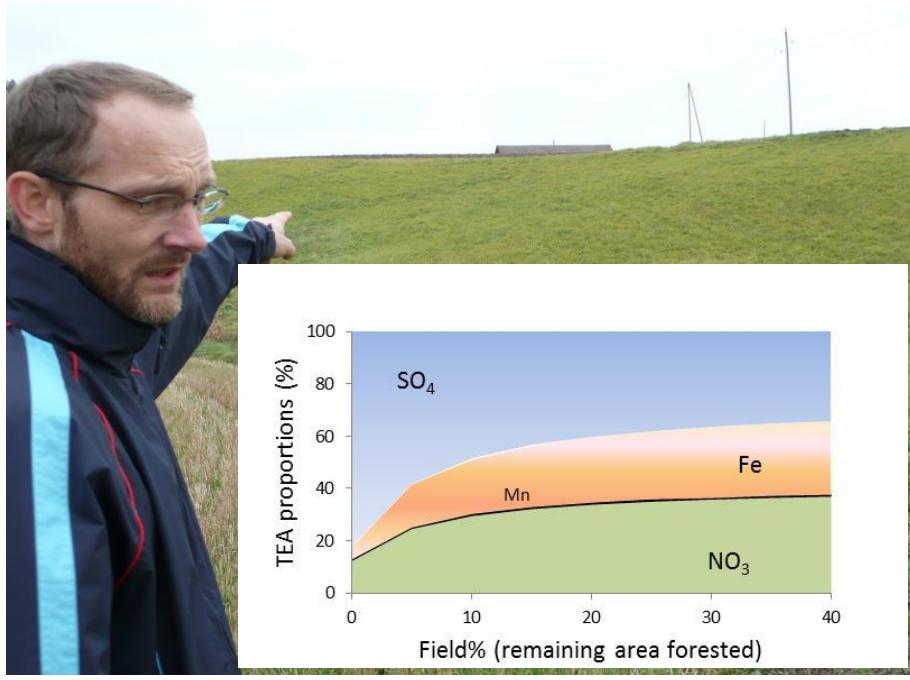

Forests

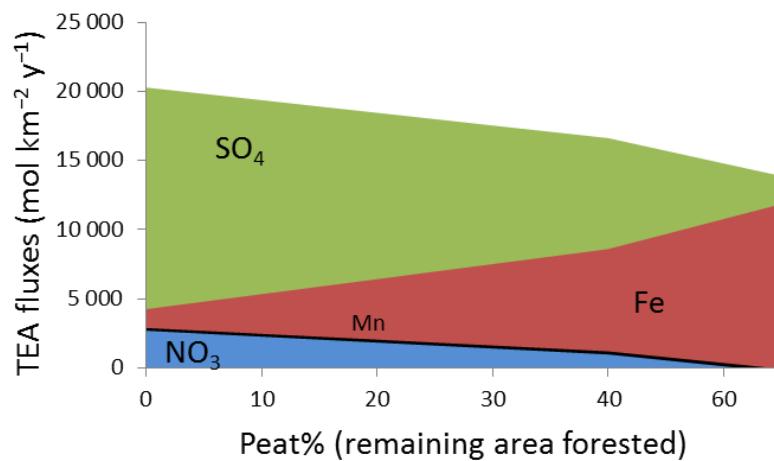

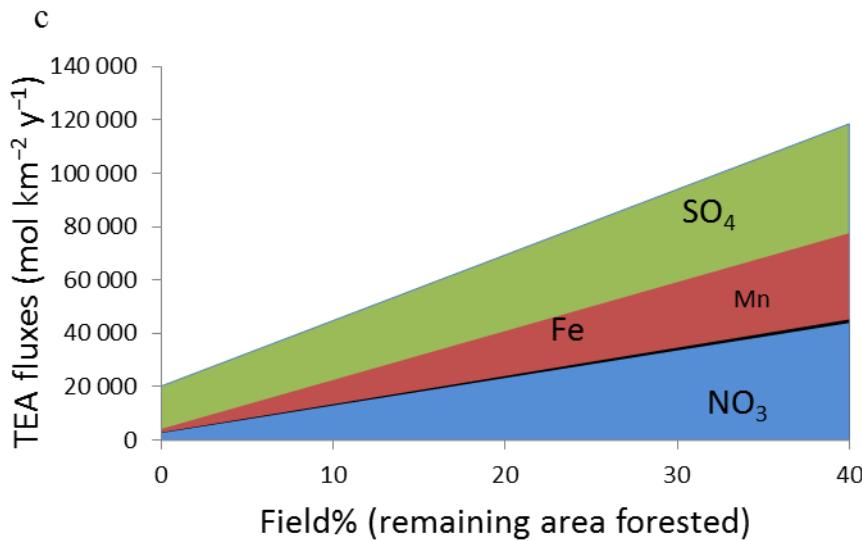

Peatlands

Land-cover regulates export of electron acceptors

- Fields export much more electron acceptors downstream than catchments with peat and forests
- Fields have exceptionally high proportion of NO_3 in export

Runoff and electron acceptors

Mattsson T., Lehtoranta J., Ekholm P., Palviainen, M., Kortelainen P.

Runoff changes have a land cover specific effect on the seasonal fluxes of terminal electron acceptors in the boreal streams.

Runoff and concentrations of electron acceptors

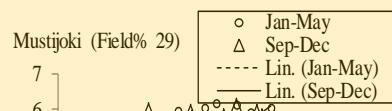

Nitrate (NO₃)

Manganese (Mn)

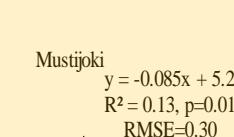

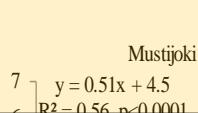

Iron (Fe)

Sulfate (SO₄)

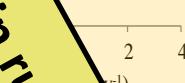

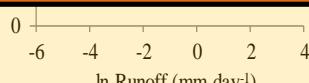

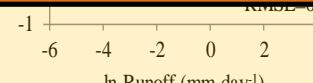

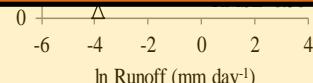

High
Field%

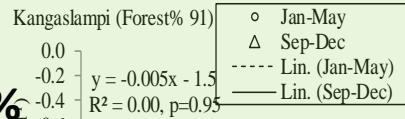

Mustijoki

Fields: Increasing runoff rises concentration

High
Forest%

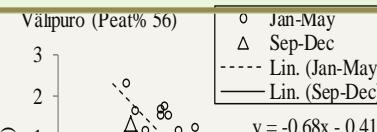

Kangaslampi

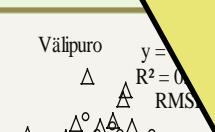

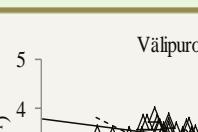

Forests: Changes in runoff correlate poorly with concentration

High
Peat%

Välimpuro

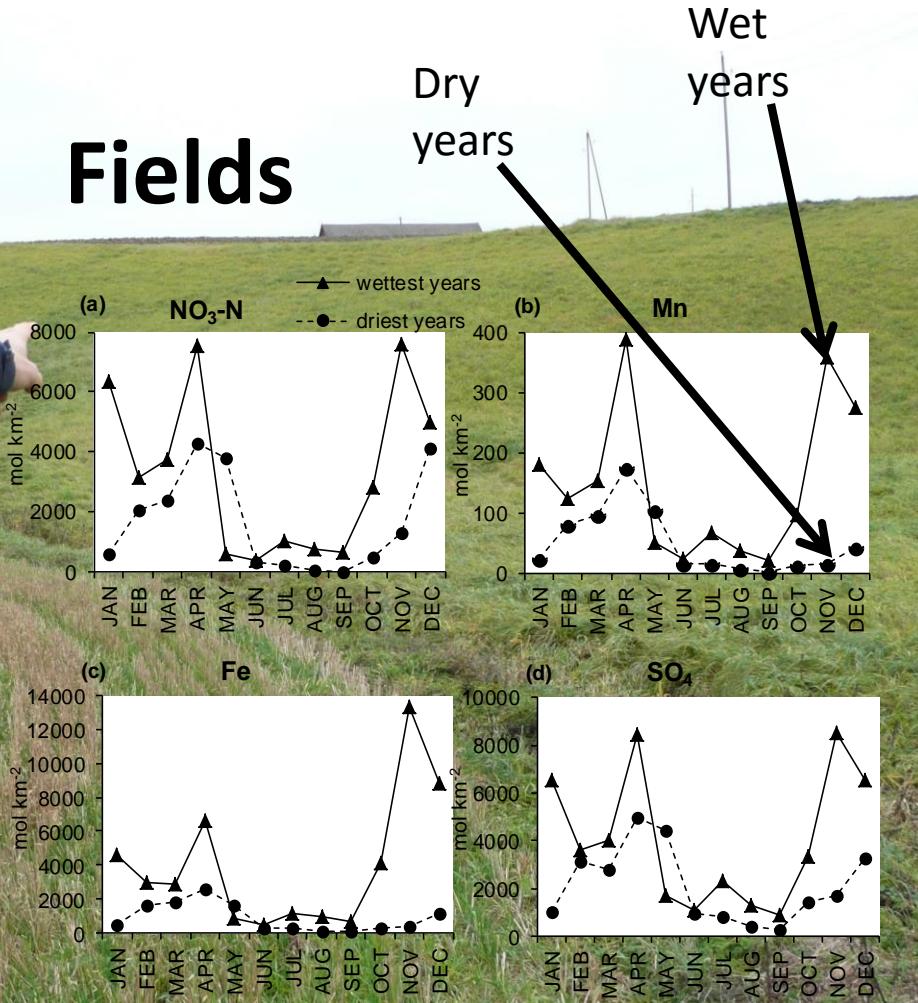

Peatlands: In general, increase in runoff decreases concentration

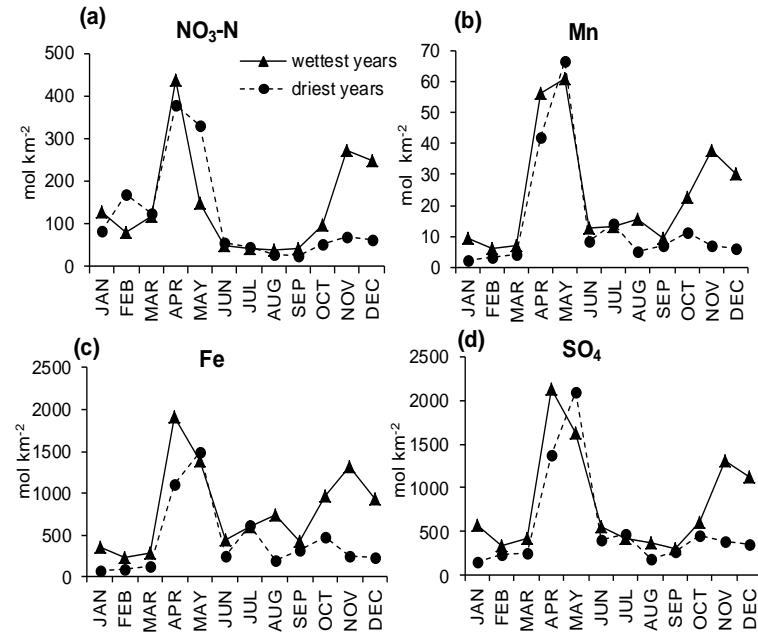

Increase in runoff decreases concentration

Runoff and export of TEAs

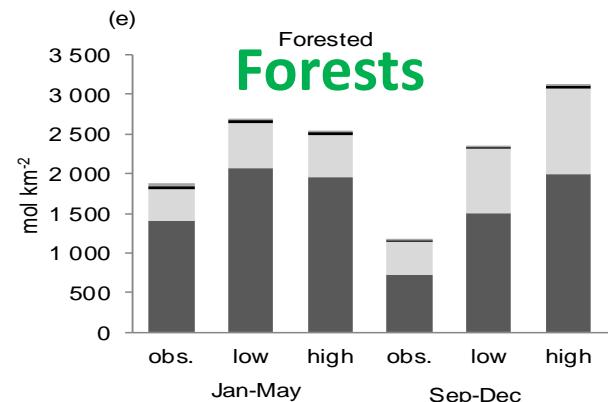

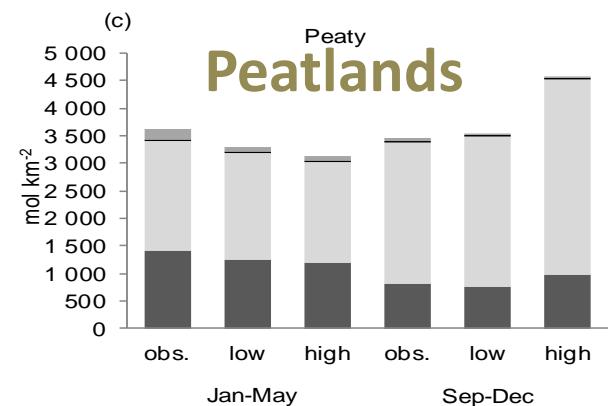

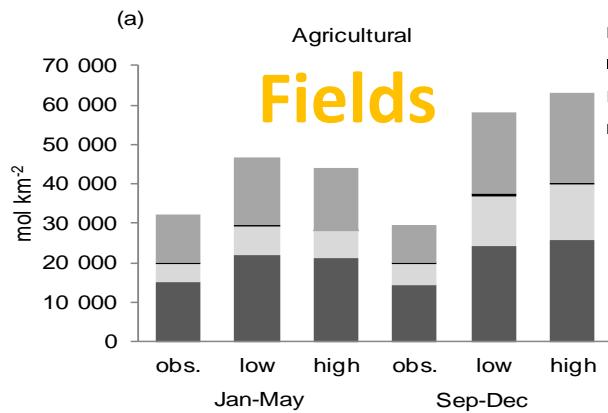

Fields

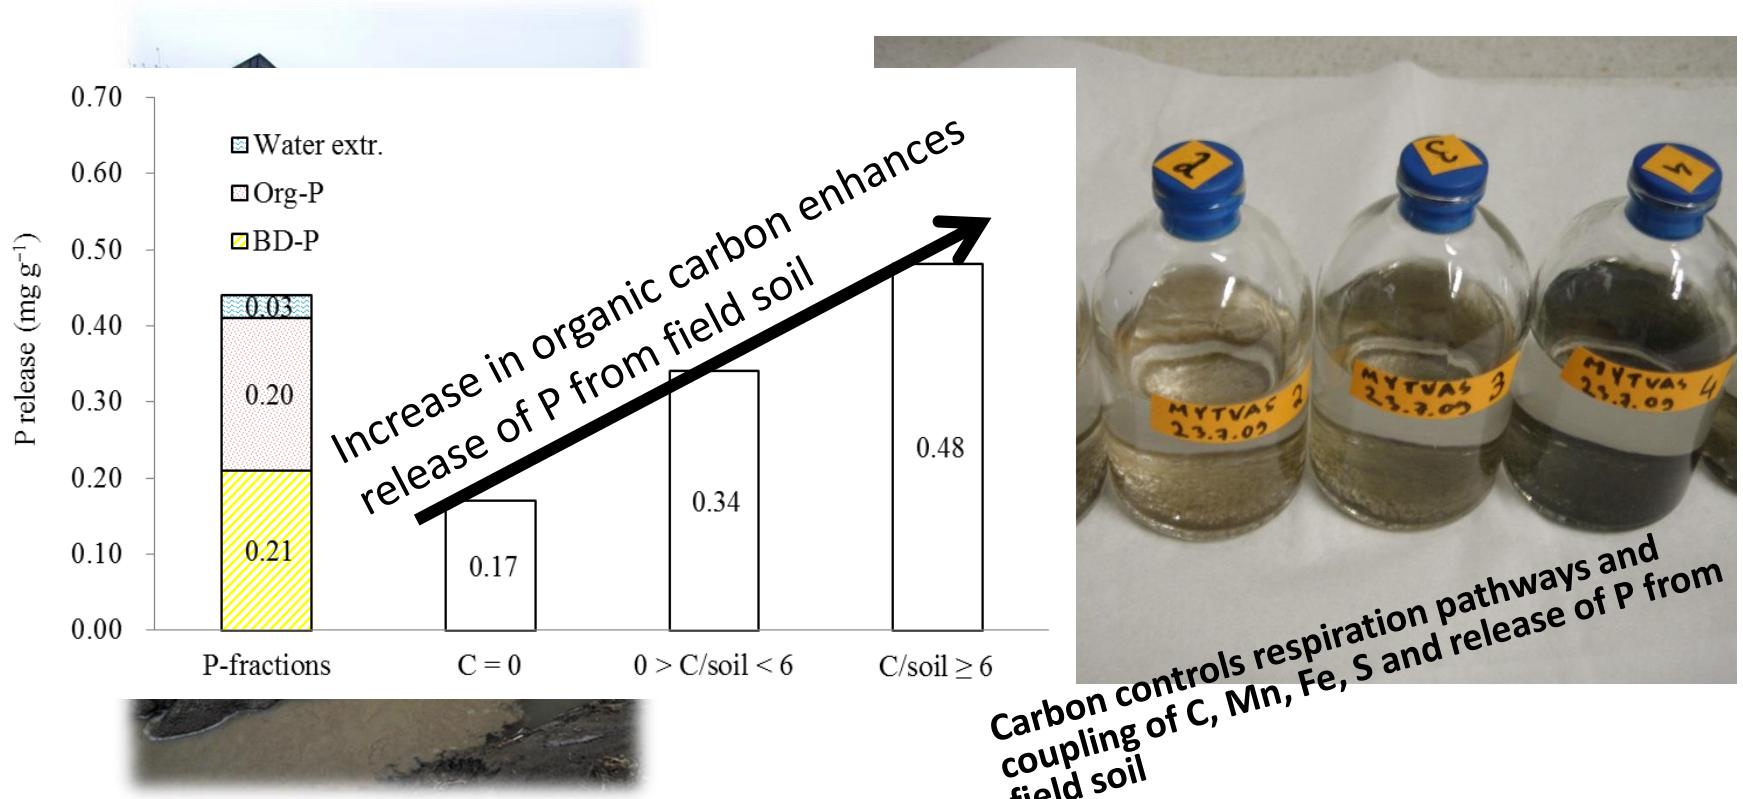

Peaty and forested catchments

Climate change induced variation in runoff may impact export of all TEAs from fields

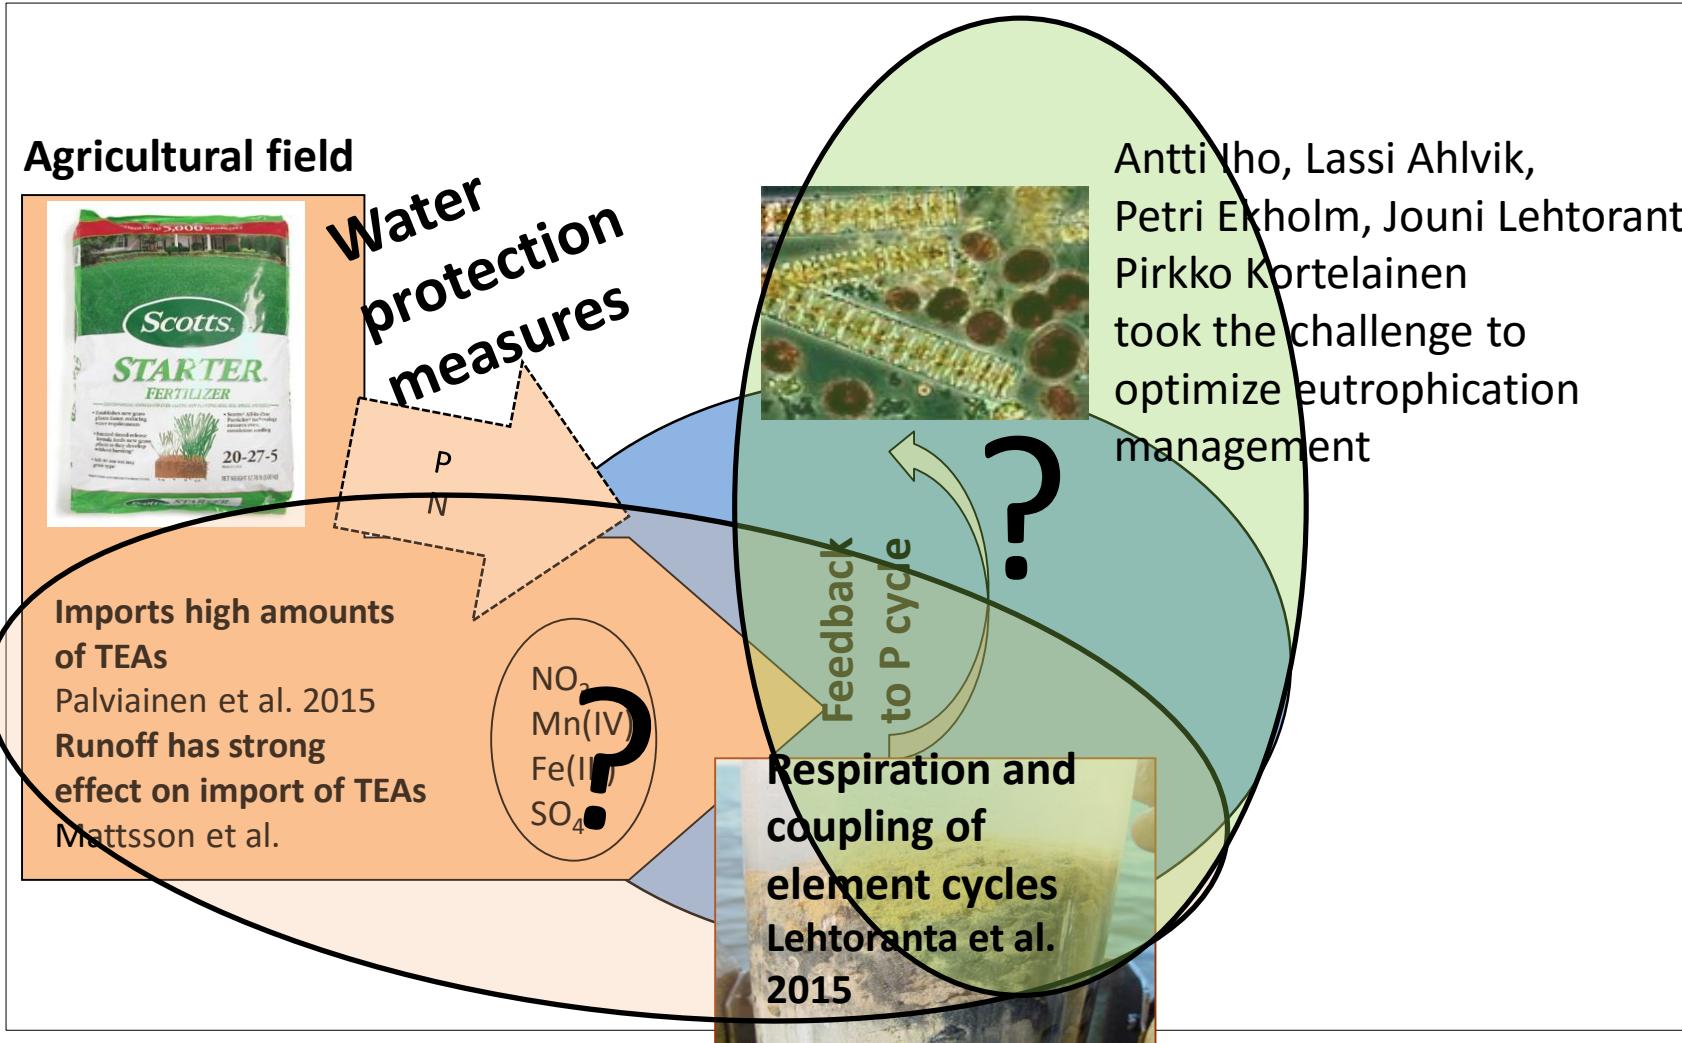

Release of field soil phosphorus in anoxic brackish water

Lehtoranta, J., Ekholm, P., Wahlström, S., Tallberg, P. and Uusitalo, R. 2015. Organic carbon regulates phosphorus release from eroded soil transported into anaerobic coastal systems. AMBIO 44: 263–273.

Optimal eutrophication management and coupled biogeochemical cycles

Thank you!
